

Invite Flow

Unknown receiver flow:

identifier -> no signed profile -> create invite -> receiver verifies email -> receiver wallet generates

Rules:

- Unknown receiver means invite only.
- No funds move before the receiver publishes a signed public payment profile.
- SatsPath does not generate seed phrases.
- SatsPath does not generate wallet private keys.
- SatsPath does not email private material.
- Email verification proves inbox access, not domain ownership.

Email content should say:

Someone wants to send you Bitcoin through SatsPath.

Click Receive to create or connect a wallet.

Your wallet will generate keys locally.

SatsPath will never see your seed or private keys.

Invite records store public routing metadata and identifier hashes. If raw email is needed for delivery, it belongs only in the platform layer and should expire.
